A single pump is a pump system consisting of a single pump body, typically including a drive unit (such as a motor), a pump head, and necessary connecting piping. Unlike multi-pump or parallel pump systems, single pumps offer a simpler structure and easier maintenance, making them suitable for applications requiring relatively stable flow and head. Their operating principle is typically based on centrifugal force, positive displacement, or other pumping mechanisms, converting mechanical energy into kinetic or potential energy of the liquid, thereby achieving fluid transport or pressure boosting. Single pumps are widely used in industry, agriculture, municipal administration, construction, and other fields, and are one of the most common pump types. They can be horizontal or vertical, driven by electric, diesel, or pneumatic power, offering excellent versatility and cost-effectiveness. The single-line production capacity is approximately 200,000 units.

United States market for Single Pump is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
