## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Insulated metal substrate (IMS) consists of a metal baseplate (aluminium is commonly used because of its low cost and density) covered by a thin layer of dielectric (usually an epoxy-based layer) and a layer of copper (35  $\mu\text{m}$  to more than 200  $\mu\text{m}$  thick). The FR-4-based dielectric is usually thin (about 100  $\mu\text{m}$ ) because it has poor thermal conductivity compared to the ceramics used in DBC substrates.

The single-sided IMS PCB has the metal substrate located at the bottom side. It also has a couple of layers, such as copper circuit layer and dielectric layer.

The global Single Sided Insulated Metal Substrates market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
