The single-stage double-suction split case pump is a compact, high-efficiency, large-flow centrifugal pump with a horizontal axial split structure and a symmetrical double-suction impeller design. The pump body is split along the axis for easy maintenance and overhaul; the double-suction impeller allows liquid to enter the impeller from both sides at the same time, greatly reducing the axial force and improving operating stability and service life. This type of pump has the characteristics of high efficiency, low cavitation and high reliability, and is widely used in municipal water supply, district heating, power plant circulating water, petrochemical processes and large-scale industrial transportation scenarios. The typical flow range can reach hundreds to 20,000 cubic meters per hour, and the head is usually between 10-150 meters. With the advancement of industrial automation and energy-saving policies, this type of pump continues to integrate intelligent control, variable frequency drive and remote monitoring functions, and is one of the main equipment in medium and large fluid transportation systems.
