The global Single Stand Reversing Cold Mill market size is predicted to grow from US\$ 458 million in 2025 to US\$ 644 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

A single stand reversing cold mill processes metal strips by passing them back and forth through a single rolling stand. This method reduces thickness, increases strength, and improves surface finish. It offers unmatched flexibility for small to medium batch sizes and specialty alloys. In 2025, global Single Stand Reversing Cold Mill production reached approximately 425 units, with an average global market price of around 1100 K US\$/Unit. The production capacity of Single Stand Reversing Cold Mill reaches 570 units, and the industry's gross profit margin is approximately between 30% and 50%.

The development of single-stand reversible cold mills is primarily driven by the growing demand for high value-added metal materials, the widespread adoption of multi-variety, small-batch production models, the ever-increasing requirements within the steel and non-ferrous metal industries regarding product dimensional accuracy and strip shape quality, and the need for enterprises to strike a balance between investment costs and production line flexibility. Against the backdrop of rising demand for specialized sheet materials?such as silicon steel, high-strength steel, stainless steel, and aluminum alloys?across sectors including new energy vehicles, electrical steel, aerospace, and high-end home appliances, manufacturers urgently require a rolling solution capable of simultaneously delivering precise control and rapid specification switching. Furthermore, the mature application of technologies such as hydraulic AGC, intelligent strip shape control, digital twins, and automated rolling schedule generation has further enhanced production efficiency and product quality, thereby solidifying the strategic position of these mills within modern metal rolling systems.
