A single thyristor is a four-layer, three-terminal semiconductor device, which is the basic type in the thyristor family. Its core function is controllable unidirectional conduction, that is, after being triggered by a gate signal, it allows current to flow from the anode to the cathode, and it can remain on after the trigger signal disappears until the current drops below the holding current or the voltage between the anode and cathode reverses.

United States market for Single Thyristor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Single Thyristor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
