The global Single-Use Cardiac Pulsed Field Ablation Catheter market size is predicted to grow from US\$ 93.62 million in 2025 to US\$ 226 million in 2032; it is expected to grow at a CAGR of 13.4% from 2026 to 2032.

A Single-Use Cardiac Pulsed Field Ablation Catheter is a sterile disposable interventional catheter used together with a cardiac pulsed field ablation system to deliver high-voltage, ultra-short electrical pulses through distal ablation electrodes to targeted myocardial tissue, thereby creating lesions through irreversible electroporation rather than a primarily thermal mechanism. In current clinical practice, these catheters are mainly intended for catheter ablation of atrial fibrillation and related arrhythmias. Public regulatory and manufacturer documents show that such catheters are generally composed of a catheter shaft, distal ablation electrodes, a handle, and connector or cable assemblies, while some platforms also support signal recording, pacing, over-the-wire delivery, navigation visualization, or contact-related sensing. Their clinical purpose is to improve tissue selectivity and reduce collateral injury associated with conventional thermal ablation, especially near structures such as the oesophagus, phrenic nerve, and pulmonary veins. Historically, the product category originates from electroporation and irreversible electroporation research, while its cardiac application evolved from early direct-current ablation work in the 1980s to modern PFA platforms enabled by dedicated generators, biphasic or bipolar waveforms, and multi-electrode catheter designs over the past decade. Based on publicly described device architectures, the upstream supply chain typically includes medical-grade polymers, conductive metals and alloys, electrode-coating materials, insulation materials, connectors, cable assemblies, handle and actuation components, optional magnetic-navigation or pressure-sensing elements, and sterile packaging and other single-use procedural accessories. In 2025, the global production capacity of single-use cardiac pulsed field ablation catheters reached 70,000

units, with sales volume totaling 47,446 units. The average selling price was US\$2,017 per unit, while manufacturers' gross profit margins generally ranged from 40% to 50%.

Based on recent regulatory approvals, launch activity, and platform positioning, the market for single-use cardiac pulsed field ablation catheters has clearly moved beyond the early validation stage and into commercial adoption and platform-based competition. Clinical use remains centered on atrial fibrillation ablation, particularly pulmonary vein isolation, but competition is no longer defined simply by the availability of a PFA catheter. Instead, it is increasingly shaped by how well a disposable catheter fits variable anatomy, integrates with the generator and mapping ecosystem, minimizes catheter exchanges, and supports expansion into broader procedural workflows. The approvals of FARAWAVE, PulseSelect, and VARIPULSE in the United States indicate that the single-use catheter has become the core consumable around which modern PFA platforms are built.

Looking ahead, the category is likely to evolve toward catheter designs that better accommodate complex anatomy, greater functional integration, broader use beyond straightforward paroxysmal atrial fibrillation, and deeper coupling with mapping systems. Public product information already shows that leading disposable PFA catheters are moving from pure therapy delivery toward more integrated workflows that support visualization, mapping coordination, fewer device exchanges, and more standardized procedures. At the same time, regulatory expansions and new platform approvals suggest that these catheters are being pushed beyond basic pulmonary vein isolation toward persistent atrial fibrillation, posterior wall treatment, and more complex electrophysiology pathways. In practice, future leadership will depend less on whether a catheter can create lesions at all, and more on whether it can do so consistently, reproducibly, and within an integrated procedural ecosystem.

The main growth drivers are the clinical appeal of a non-thermal mechanism with the potential for greater tissue selectivity and collateral tissue protection, together with improved procedural efficiency, sustained investment from major device manufacturers, and strengthening evidence from pivotal studies. The ADVENT trial showed noninferiority of pulsed field ablation versus conventional thermal ablation on key endpoints, while the latest HRS/EHRA scientific statement highlighted favorable workflow efficiency and collateral safety but also emphasized that the technology brings distinct biophysical behavior and safety considerations that must be understood carefully. The barriers are equally important: outcomes may vary across catheter designs and waveform platforms, long-term lesion durability and performance in more

complex targets still require deeper evidence, hospital adoption depends on training and platform readiness, and safety-related investigations and labeling updates for specific devices can slow expansion and raise the threshold for broader use. As a result, this market is likely to keep growing, but in a way that is increasingly evidence-led, protocol-driven, and risk-managed.
