A disposable intranasal irradiation fiber optic head is a medical device designed for single-use application inside the nasal cavity to deliver targeted light therapy. It likely consists of a removable, disposable nasal adapter connected via a fiber optic cable to a light source, and is used to treat conditions such as allergic rhinitis, sinusitis, and other inflammatory or hyperproliferative diseases of the nasal lining. The disposable nature of the device helps prevent cross-contamination and ensures sterility. The upstream industry forms the foundation of product manufacturing, primarily responsible for providing various raw materials and production equipment. Its technological level and cost directly determine the performance and price of midstream products. Quartz optical fiber is the core raw material for manufacturing quartz optical fiber, requiring extremely high purity and consistency. Its quality directly determines the fiber's transmission efficiency and laser-resistant power. Polymer optical fiber materials, such as PMMA (polymethyl methacrylate), are used to manufacture plastic optical fibers; they are lower in cost but require high light transmittance and uniformity from the raw materials. The midstream industry is the core of the industrial chain, transforming upstream raw materials into final medical device products. Downstream end-user hospitals are the final users and core payers of the products; procurement decisions are typically made
