Single zone ductless heat pump is a split-type air conditioning system that integrates cooling and heating functions. It consists of an indoor unit and an outdoor heat pump unit, which are connected by refrigerant pipes and can provide efficient year-round climate control for a single space (such as a bedroom, living room or office) without relying on traditional air ducts. The system adopts the reverse Carnot cycle principle and realizes energy transfer through variable frequency compressors and heat exchangers. It cools in summer and heats in winter. It has the advantages of high energy efficiency, fast response and flexible installation. Compared with central air conditioning or gas heating equipment, single-zone ductless heat pumps are quiet, energy-saving and environmentally friendly. They are suitable for new residential buildings, renovation of old houses and local space temperature control. They have become one of the important climate solutions for low-carbon buildings and energy upgrades in North America, Europe and Asia-Pacific.
