The global Singlebeam Hydrographic Echosounders market size is predicted to grow from US\$ 209 million in 2025 to US\$ 250 million in 2031; it is expected to grow at a CAGR of 3.0% from 2025 to 2031.

Singlebeam hydrographic echosounders, often referred to as singlebeam sonar systems or singlebeam sounders, are specialized instruments used in hydrography to measure water depth and map the seafloor or riverbed. These devices utilize the principle of echolocation, where sound waves are transmitted into the water and the time it takes for the signal to bounce back is used to calculate the water depth. Unlike multibeam echosounders, which use an array of beams to acquire swath coverage, singlebeam echosounders emit a single acoustic beam directly below the instrument.

Continuous efforts have been made to enhance the accuracy and resolution of singlebeam echosounders. This involves improvements in signal processing algorithms, transducer design, and overall system calibration.
