Sinker EDM (Electrical Discharge Machining) is a manufacturing process in which a shaped electrode (typically made of graphite or copper) and a workpiece are submerged in an electrically conductive fluid. Additionally, a controlled electrical charge is passed between the two. Sparks are created as the electrode approaches the workpiece, melting the material on the workpiece's surface. Subsequently, the fluid flushes away this melted material, and the electrode contours the design's shape. This process is repeated to create the required form.

The electrical charge used is very high, but it only lasts briefly. Consequently, the process requires precise control because the electrical discharge can damage the workpiece and must be repeated to achieve the required shape. Sinker EDM creates tools, dies, and molds for the automotive, aeronautical, and medical industries.

The global Sinker EDM Service market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
