The global Sintered-Metal Self-Lubricating Bearing market size is predicted to grow from US$ 1431 million in 2025 to US$ 1905 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Sintered-Metal Self-Lubricating Bearing is a type of bearing that combines the strength and durability of sintered metal with the self-lubricating properties of embedded solid lubricants. Sintered metal bearings are made by compressing and heating metal powder to create a porous, yet strong, structure. These bearings are then infiltrated with solid lubricants, such as graphite, molybdenum disulfide, or polytetrafluoroethylene (PTFE), which provide lubrication during operation without the need for external lubrication. This self-lubricating feature reduces friction, wear, and heat generation, leading to longer bearing life and reduced maintenance requirements. Sintered-metal self-lubricating bearings are widely used in applications where traditional oil or grease lubrication is impractical or impossible, such as in vacuum environments, high-temperature conditions, or where contamination must be minimized.

United States market for Sintered-Metal Self-Lubricating Bearing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Sintered-Metal Self-Lubricating Bearing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Sintered-Metal Self-Lubricating Bearing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
