A sintering aid is an additive used to enhance and stabilize the sintering process of metal and ceramic powders. These aids usually have a lower melting point than the primary material being sintered.

Sintering aids are carefully added to the powders in amounts that don't compromise the material's properties. They are particularly useful for sintering materials that are otherwise difficult to sinter or to improve density and strength post-sintering. Commonly used sintering aids include boron, carbon, alkaline earth metals, and rare earth oxides, which are particularly effective for ceramic sintering, enhancing densification and thermal conductivity.

The global Sintering Aid market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
