The testing of silicon photonics mainly includes the testing of its optical and electrical performance. The testing is mainly divided into two stages: wafer-level testing and module-level performance testing after packaging. Wafer-level testing refers to the testing and screening of each unit or sub-unit on the wafer with the help of a probe station after the wafer production is completed; module-level performance testing after packaging, when the device is packaged into a module, it is necessary to verify the performance of the module's transmitter and receiver at different ambient temperatures and compliance with relevant specifications. These tests are performed when sending or receiving optical/electrical signals at normal rates, and must strictly refer to relevant specifications.
