The siphon decanter is a fully automatic regulating tank drainage equipment, and is also a key equipment in sewage treatment processes such as SBR (intermittent activated sludge process). The working principle of the siphon decanter is based on the siphon phenomenon. When the water level in the sewage treatment tank reaches a certain height, the siphon decanter is started. At this time, the decanting weir is immersed in the water, and as the water level rises, the water flows into the siphon tube through the decanting weir. When the siphon tube is full of water, due to the siphon effect, the water will automatically flow out of the siphon tube and discharge from the treatment tank through the drainage pipe. As the water level in the treatment tank drops, the decanting weir also drops. When the water level drops to a certain level, the siphon effect is destroyed and the decanting process stops.
