The global Siphonic Drainage System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Traditional gravity drainage systems create a whirlpool effect, which allows water and air to enter the pipe. The presence of air creates a vortex, which pushes the water to the edges of the pipe. This means less water can drain, and so bigger downpipes are required to compensate. Water needs gravity to drain, so if there is no slope on the roof or on horizontal pipework, standing water will accumulate. Outlets for siphonic drainage systems are fitted with a baffle plate, which restricts air from entering the system. In very low levels of rain, it works in the same way as a gravity system. However, as rainfall increases and the water reaches a specific head level, the baffle plate only allows water to enter the system. This means it 'runs full' creating negative pressure which sucks standing water into the drainage system – it operates in a similar way to emptying a fish tank.

United States market for Siphonic Drainage System is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
