The global Skin Effect Heating System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The pipeline skin effect electric heating (skin electric heating) technology is a new metal pipeline heating method that has emerged in recent years. It is a new technology and process for heating and heat preservation of heat transmission pipelines in large petrochemical enterprises. It is referred to as the 'SECT method' abroad. This heating technology has high efficiency and is suitable for heating and heating of all long, medium and short distance metal infusion pipelines. It is also safe, reliable, easy to install and maintain, so it is widely used in pipeline transportation of liquid substances of various properties. The pipeline skin effect electric heating (skin electric heating) technology device is basically composed of a transformer, a heating power supply, an infusion pipe, a heating pipe and a skin cable, an insulation layer, a protective shell and other parts. The heating power supply is divided into two types: industrial frequency and medium frequency heating power supply; the infusion pipe and the heating pipe are ordinary steel pipes, the diameter of the heating pipe is 15-40mm, and it is intermittently welded on the infusion pipe; the heating cable is passed through the heating pipe, and the outside is an insulation layer and a protective shell.
