The report requires updating with new data and is sent in 48 hours after order is placed.

Skin stretching is also known as external expansion and traction, that is, the normal skin on both sides of the wound edge is pulled toward the center by external force, and the skin's viscoelasticity and mechanical stretchability are used to generate 'extra' skin through linear load, thereby closing the soft tissue defect wound. The device that works on this technique is called a skin stretcher.
