A skin hook is a small medical instrument that is used to grasp, hold, and position delicate soft tissues during the suturing phase of a surgical procedure. It may have one or two very thin curved hooks at the end of the tool and is often used with a needle holder during suturing to reduce the damage to the fragile tissue being stitched closed. Skin hooks are used in many different medical procedures that require the gentle maneuvering of skin and soft tissue, including corrective surgical procedures on the eyes, suturing facial skin, and stitching the delicate individual layers of the skin.
