Skin moisture analyzers are portable devices that can test various skin factors using something called bioelectric impedance analysis (BIA). Two probes on the end of these small, stick-like gadgets use BIA technology to pass a painless electric current from one sensor through the skin to another. Your skin's moisture level is determined by the time it takes for that current to travel through the skin, usually displayed in a percentage on an LCD screen. In addition to your skin's moisture, analyzers can also determine oil content and softness levels.
