The research report highlights the growth potential of the global Skin Packaging market. Skin Packaging are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Skin Packaging. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Skin Packaging market.

Skin packaging is classified into two types: Carded and non-carded. Carded skin packaging consists of a piece of paperboard and a thin sheet of transparent plastic heat sealing, which is wrapped over the paperboard. The product is placed between them during the packaging process. Non-carded skin packaging consists of a thin sheet of plastic wrapped over the product. A vacuum is created between the product and skin packaging to avoid contamination of the product due to contact with air.

During 2017, the carded skin packaging segment dominated the skin packaging market and accounted for a major part of the overall market share. The major reason responsible for the growth of this segment is the barrier properties of packaging films used by the carded skin packaging, that extends the shelf life of the packaged products and minimizes leakages.
