Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Skin packaging involves placing a product on a substrate material such as paperboard or corrugated. Heated plastic film is draped over the product and the substrate, and a vacuum draws the film down tightly to the board and around the product to make a secure and attractive package.

A skin package has four components: the plastic film, a heat seal coating, printing ink and a paperboard or corrugated paperboard. After printing, the board is coated with a heat-seal dispersion coating. The board is placed on a vacuum platen and product is placed on the board. Film is held tightly in place by a clamping frame, directly below the heater.
