Skin grafts are used in a surgical procedure known as skin grafting where the skin is removed from one part of the body and is transplanted to another area where skin is lost due to burns or injuries. The skin graft can be harvested from donor's skin tissue but may lead to a risk of rejection by the recipient's body or infection to the recipient. Various types of equipment used for skin grafting are dermatome, general surgical instruments, and consumables. Skin grafts are performed when the injured skin has lost its capability to heal itself, hence its operational procedure is expensive. In case of severe skin restoration, the physician may need to obtain skin from another donor, which may make the procedure more expensive compared to the cost if the skin would be if the skin is obtained from the same person. Otherwise. The total cost of skin grafting is decided based on factors such as, the hospitalization charges, donor's fees,

medications, surgeons' fees, operational charges, post operational charges and consultation fees. The area of wound also determines the cost of the procedure.

The global skin transplantation market is projected to experience steady growth in the coming years. Skin transplantation, also known as skin grafting, is a surgical procedure that involves the replacement of damaged or diseased skin with healthy skin from another part of the body or from a donor.
