Skived heat sinks refer to a type of heat sink that is manufactured using a skiving process. Skiving involves shaving or slicing a solid block of metal, typically aluminum or copper, to create a finned structure. The fins are formed by removing thin layers of material from the block, creating a series of closely spaced parallel fins.

The skiving process offers several advantages in heat sink manufacturing, including precise control over fin thickness, height, and spacing. It also allows for customization of the heat sink design to meet specific thermal requirements. Skived heat sinks are commonly used in electronic devices, such as computers, servers, power modules, LED lighting, and telecommunications equipment, where efficient heat dissipation is critical for maintaining component performance and reliability.
