Abstracts

The global Skiving Machining Center for Gears market size is predicted to grow from US$ 241 million in 2025 to US$ 299 million in 2032; it is expected to grow at a CAGR of 3.2% from 2026 to 2032.

In 2024, global sales of skiving machining centers for gears will reach approximately 975 units, with an average unit price of approximately US$245,000 per unit and an overall gross profit margin of approximately 28%. Gear skiving machining centers are a type of integrated high-precision machine tool specifically designed for efficiently cutting and forming internal and external gears from semi-finished blanks using a "gear skiving" process. This process combines the principles of gear hobbing and gear shaping, achieving rapid machining through relative rotation between the tool and workpiece and axial feed. It is particularly suitable for the manufacture of core components such as automotive transmissions, wind turbine gearboxes, aviation gear transmissions, and high-precision robotic reducers. Compared to traditional gear shaping, it offers 2–5 times higher cutting speeds, resulting in higher machining efficiency and tooth surface accuracy. It is also gradually replacing some gear grinding processes in the hard gear surface machining sector. In terms of the upstream and downstream structure, the upstream sector primarily relies on suppliers of high-speed steel/carbide cutting tools, machine tool castings, high-precision spindles, and CNC systems, while the downstream sector is concentrated in automotive OEMs, wind turbine equipment manufacturers, aviation transmission system manufacturers, and robotic joint reducer companies. Among them, Pittler T & S GmbH has an annual production capacity of approximately 70 units, focusing on covering the European high-end automotive gear and electric vehicle reducer markets.
