Abstracts

The global SLAM Navigation AGV Solution market size is predicted to grow from US$ 670 million in 2025 to US$ 2351 million in 2032; it is expected to grow at a CAGR of 20.0% from 2026 to 2032.

SLAM Navigation AGV Solution refers to an Automated Guided Vehicle (AGV) system that relies on SLAM (Simultaneous Localization and Mapping) technology to achieve autonomous navigation, positioning, path planning, and task execution without relying on pre-installed artificial markers (such as magnetic strips, QR codes, or laser reflectors). Unlike traditional AGV navigation methods (e.g., magnetic navigation, QR code navigation) that require fixed environmental modifications, SLAM navigation enables AGVs to adapt to dynamic and complex environments, making it a core technology for flexible automation in industries such as manufacturing, logistics, and warehousing.

SLAM (Simultaneous Localization and Mapping) is a key technology in robotics and autonomous systems. Its core capability is to allow a mobile device (e.g., AGV, robot) to:

1) Localization: Determine its own real-time position and posture in an unknown or changing environment.

2) Mapping: Continuously construct and update a digital map of the surrounding environment (including obstacles, landmarks, and spatial structures) while moving.

In short, SLAM enables AGVs to "draw a map while finding their way"—a capability that breaks the dependence on fixed navigation markers.
