The sleep tracking sensor is electrically interconnected by two crimped solder tabs. When subjected to dynamic strain (length change), the belt will produce a charge or voltage output. When installed on a line parallel to the chest/heart on a mattress, the belt can detect heart sounds, as well as small changes in the load or center of gravity due to breathing, and then can be evaluated over a longer period of time (for example, overnight) These signals, they can show the duration, stage or quality of sleep.
