A slide core unit is a mold component primarily used in resin molding. It's a movable part within a mold, facilitating the production of products with undercuts or complex inner geometries in a single molding process. Although integrating a slide core unit mechanism allows for intricate shapes in one go, it's important to note the potential increase in tooling costs and design issues due to more detailed molds and additional parting lines.

Slide core units are essential for creating undercut areas in plastic molded products, which are shapes that obstruct the normal path of demolding. These units enable the forming of such areas, allowing for the product's removal in one molding cycle. While a simple cup can be de-molded with a standard mold, a cup with a handle necessitates a slide core unit due to the undercut. This technology is also pivotal in producing complex plastic items like construction window frames, door handles, and electronic device housings.

The global Slide Core Unit market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
