A sliding rotary bushing is a mechanical component used to support and reduce friction, and is usually used in applications that need to withstand both rotational and linear motion. It consists of two inner and outer ring structures, the inner ring is connected to the rotating shaft, and the outer ring is in contact with the fixed part. During operation, lubricating oil or grease is used to reduce friction between the inner and outer rings to ensure smooth rotation and sliding. Sliding rotary bushings are commonly used in mechanical transmission systems, robots, automation equipment and other fields, especially in high load, low speed and long-term working environments, and can provide high wear resistance and stability.
