The global Slider Coupling market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Oldham coupling, also known as metal cross slider coupling, has a circular slider and is made of steel or wear-resistant alloy. The cross slider coupling is suitable for transmission with low speed and large transmission torque. The Oldham coupling consists of two bushings and a center slider. As a torque-transmitting element, the center slider is usually made of engineering plastics, and other materials, such as metal materials, can be selected in special cases.

In recent years, with the development of the machinery industry towards mechatronics, downstream users have put forward higher requirements for the technology and performance of couplings. High speed, heavy load, high precision, stable operation, high transmission efficiency and simple maintenance are the couplings. The technical development direction of the device, its technological innovation is mainly reflected in the optimization and improvement of the production process, process, and product structure. As a transmission connector, industrial couplings are mainly used in major equipment sets such as metallurgical equipment and mining machinery. The development of the industry is affected by the development scale and trend of downstream industries.
