A Slump Test Device is a specialized apparatus used in civil engineering and construction to measure the consistency and workability of freshly mixed concrete. It is a simple and widely used test to assess the flow and deformation properties of concrete, providing valuable information about its suitability for placement and construction purposes. The test involves measuring the 'slump' or drop in height of a concrete cone when it is removed from a mold.

Some modern Slump Test Devices may incorporate digital measurement capabilities. This can include using sensors or cameras to precisely measure the slump height and provide digital readouts. Automation features may also be integrated to ensure consistent and accurate measurements.
