Small binding screws are designed for fastening objects with internal threads. Unlike other screws, they do not require a tapered counterbore on the fastened object, allowing the screw head to protrude slightly. Due to their large head diameter, small binding screws provide a significant contact area, preventing indentation under surface pressure. They are chosen over truss screws when a smaller head diameter is needed, serving a general purpose similar to pan-head machine screws. Their rounded head also offers an aesthetically pleasing appearance for visible applications.

The global Small Binding Screws market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
