The global Small Hull Cleaning Robot market size is predicted to grow from US\$ 29.01 million in 2025 to US\$ 67.04 million in 2032; it is expected to grow at a CAGR of 13.0% from 2026 to 2032.

In 2024, global small hull cleaning robot production reached approximately 753 units, with an average global market price of around US\$ 36,300 per unit.

Small hull cleaning robot is a new type of robot, which is fully or semi-automatically controlled. The small hull cleaning robot can inspect the hull underwater and perform cleaning work on the hull, which is ideal for cleaning large ships. It can make the cleaning process safe and economical.

According to statistics, the annual cleaning cost of the global shipbuilding industry is close to 10 billion US dollars. Therefore, cleaning the biological layer attached to the surface of the ship is very important. It can not only save energy and reduce emissions, extend the docking cycle of the ship, ensure the efficiency of ship transportation, but also reduce fuel consumption and transportation costs from an economic perspective. Using manual cleaning of ships not only takes a long time, but also requires high costs. The small hull cleaning robot is highly intelligent and requires relatively low costs. Therefore, it has received widespread attention from various countries around the world.

Because the ship has been sailing or anchoring in a highly corrosive seawater and strong adhesion marine biological environment for a long time, it is difficult to perform normal maintenance, causing barnacles, oysters, bryozoans, flower tube polyps, lime worms, seaweed, etc. to be attached to the part below the waterline of the hull. Microorganisms that are difficult to remove, as well as some rust scales and rust spots,

etc. This increases the mass of the hull, increases the roughness of the outer surface, and significantly increases the resistance when moving forward in the water, resulting in a decrease in ship speed and a significant increase in fuel consumption. According to statistics, the annual cleaning cost of the global shipbuilding industry is close to 10 billion US dollars. Therefore, cleaning the biological layer attached to the surface of the ship is very important. It can not only save energy and reduce emissions, extend the docking cycle of the ship, ensure the efficiency of ship transportation, but also reduce fuel consumption and transportation costs from an economic perspective.

Low cost and good cleaning effect. Using manual cleaning of ships not only takes a long time, but also requires high costs. The small hull cleaning robot is highly intelligent and requires relatively low costs.
