Abstracts

The global Small Incision Lenticule Extraction Equipment market size is predicted to grow from US$ 171 million in 2025 to US$ 399 million in 2032; it is expected to grow at a CAGR of 13.1% from 2026 to 2032.

The Small Incision Lenticule Extraction (SMILE) equipment market represents a specialized but increasingly important segment of ophthalmic surgical technologies, sitting within the broader field of refractive surgery equipment. Unlike LASIK, which requires both an excimer laser and a femtosecond laser to create a corneal flap and then reshape the corneal stroma, SMILE uses a femtosecond laser alone to create a lenticule inside the cornea, which is then extracted through a very small incision. This streamlined approach reduces the number of machines and consumables required per procedure, provides better corneal biomechanical stability, and often reduces the incidence of post-operative dry eye. These clinical advantages are directly shaping the market for SMILE equipment because clinics and surgeons increasingly view investment in such technology as a way to differentiate their services, attract patients seeking minimally invasive options, and improve long-term outcomes.

The market itself is relatively concentrated, with a few manufacturers holding a dominant position due to the regulatory and technological barriers required to develop, certify, and commercialize femtosecond laser platforms capable of performing SMILE. Zeiss, with its VisuMax system and its newer VisuMax 800 platform, has established itself as the pioneer and continues to occupy a strong leadership position. The market structure is therefore characterized by high barriers to entry, capital-intensive R&D requirements, and a need for long-term surgeon training and support infrastructure, which together create a high degree of vendor lock-in. However, as patents expire and as other ophthalmic device manufacturers work on comparable femtosecond laser

systems, the market may see an increase in competition in the coming years.
