A small pyrolysis machine is a device designed to thermally convert various types of waste materials into useful products such as fuel oil, carbon black, and gas. These machines are small, compact, and designed for use in small-scale waste recycling and management processes. The working principle of small pyrolysis machines is based on the process of pyrolysis, which involves heating organic materials in the absence of oxygen to break them down into smaller molecules. The process results in the release of gaseous products and the formation of solid and liquid by-products, which can be

used for various purposes. Small pyrolysis machines are typically used for processing waste materials such as plastic, rubber, and biomass. They are cost-effective and easy to operate, making them ideal for small businesses and communities. They can also help to reduce waste and prevent pollution, as the waste materials are converted into useful products rather than being disposed of in landfills or burned in incinerators.
