The small satellite propulsion system is a device used to provide the force and torque required to change the orbit of a small satellite and maintain the satellite's pointing change. This system essentially uses the working fluid carried by the satellite and uses the reaction principle to enable the satellite to obtain external forces to change its own state. The small satellite propulsion system is mainly used to maintain the orbital altitude of the satellite and avoid orbit descent. It is also used to adjust the attitude to maintain the stability of the satellite.
