Small waterplane area twin hull ship (SWATH), also known as semi-submersible catamaran. A new type of ship developed in the 1970s to improve the ship's wave resistance. It is named because its waterline area is only about 1/4 of that of an ordinary ship with the same displacement. It consists of three parts: an above-water platform, an underwater buoy, and a pillar that passes through the water surface. Most of the displacement volume of the small waterplane area catamaran is deeply immersed in the water, and the waterline area of the pillar is very small, which can greatly reduce the wave resistance and significantly weaken the interference of the waves, thereby reducing the swaying movement of the ship in the waves and the wave impact.
