Smart contracts are protocols used to facilitate, verify, and/or enforce contracts on a digital medium. These self-executing contracts can be safely executed and authenticated without third parties and cannot be reversed. Each transaction is documented on a blockchain or distributed ledger system as well, increasing traceability and transparency across the ledger.

Companies use smart contracts to improve the security of transactions. Smart contracts are heavily encrypted and provide superior protection over standard encryption technology. Their self-executing nature can speed up transactions and increase accuracy as well. Smart contracts also improve transparency since requirements are well defined and transactions are all documented and irreversible.

Some blockchain platforms and blockchain payment solutions offer smart contracts or allow users to create, manage, and execute transactions digitally.

The global Smart Contracts Software market size is projected to grow from US\$ 524.4 million in 2023 to US\$ 2515.4 million in 2030; it is expected to grow at a CAGR of 25.1% from 2024 to 2030.

Increasing adoption of hybrid cloud models: As organizations seek to optimize their cloud investments and leverage the best of both public and private clouds, they will need smart contracts software that can support hybrid cloud scenarios. This will require seamless integration of smart contracts software across different cloud platforms and providers.

Growing demand for zero-trust security: As cyberattacks become more sophisticated and frequent, organizations will need to adopt a zero-trust security approach that assumes no trust for any user or device accessing the smart contracts software. This will require smart contracts software that can implement granular and dynamic policies based on contextual factors such as user behavior, device posture, location, time, risk level, etc

Rising use of artificial intelligence and machine learning: As the volume and complexity of smart contracts data and logic increase, organizations will need to leverage artificial intelligence and machine learning to automate and enhance their smart contracts processes. This will include using AI/ML for identity verification, anomaly detection, threat prevention, policy optimization, user experience improvement, etc.

Expanding role of blockchain technology: As organizations seek to improve the transparency and trustworthiness of their smart contracts transactions and interactions

with external parties, they will need to explore the potential of blockchain technology for their smart contracts software. This will include using blockchain for decentralized identity management, self-sovereign identity (SSI), verifiable credentials (VCs), smart contracts orchestration, cross-chain interoperability, etc.
