Abstracts

The global Smart Fisheries Integrated Management Platform market size is predicted to grow from US\$ 158 million in 2025 to US\$ 316 million in 2032; it is expected to grow at a CAGR of 10.5% from 2026 to 2032.

The Smart Fisheries Integrated Management Platform is an integrated digital management solution designed for modern aquaculture enterprises, fishing fleets, and marine aquaculture bases. Through IoT sensors, satellite positioning, data analysis, intelligent early warning, and cloud management, it enables water quality monitoring, stocking density optimization, feeding management, fishing trajectory tracking, and environmental risk control. The system typically includes water quality sensors, video monitoring equipment, GPS positioning modules, data processing terminals, and management platform software, capable of real-time collection and analysis of water temperature, dissolved oxygen, pH, ammonia nitrogen concentration, and fish activity status.

Upstream raw materials mainly include sensors, electronic modules, communication equipment, and software development components; downstream suppliers primarily include large-scale aquaculture enterprises, fishing fleets, and marine ranches.

In the future, with the increasing demand for intelligent, sustainable, and remote management in marine fisheries, the Smart Fisheries Integrated Management Platform market will continue to grow. Business opportunities will mainly focus on high-precision sensors, intelligent analysis algorithms, remote monitoring, and data-driven aquaculture optimization solutions, while also extending to digital fisheries ecosystems and integrated service platforms.

The market for intelligent fisheries integrated management platforms is experiencing rapid growth, primarily driven by global fisheries intelligent upgrades, sustainable development policies, and the demand for marine resource management. As modern aquaculture enterprises and fishing fleets increasingly demand water quality monitoring, stocking density control, feeding optimization, and fish activity tracking, traditional manual management methods are gradually being replaced by digital and intelligent management platforms.

Upstream supply of sensors, communication modules, and data processing equipment is relatively stable, but high-precision water quality sensors, long-life video monitoring equipment, and intelligent data analysis algorithms remain key technological and cost factors. Downstream customers are mainly large-scale aquaculture enterprises, fishing fleets, and marine ranches, resulting in a high market concentration. Meanwhile, demand for low-cost, modular platforms from small and medium-sized aquaculture farms is also steadily increasing.

In the future, with the development of digitalization, remote monitoring, and intelligent algorithm optimization in marine fisheries, intelligent fisheries integrated management platforms will not only be used for single-point management but will also be deeply integrated with fisheries ecosystems, meteorological, and marine data platforms to form a data-driven decision support and comprehensive service model, providing enterprises with long-term market growth potential and technological innovation space.
