A Smart Health Cabin is a modular health service space that integrates health measurement devices, digital management systems, and telehealth connectivity. Typically designed as an enclosed or semi-enclosed cabin, it enables self-service or assisted health screening and basic medical checkups. Common functions include vital sign measurement such as blood pressure, heart rate, body temperature, SpO₂, body composition, and height/weight, with optional modules for ECG, blood glucose, and urine testing. It also supports data upload to cloud platforms or healthcare information systems for health record creation, chronic disease screening and management, risk alerts, and online consultation linkage. Smart health cabins are widely deployed in community public health, hospital checkup triage, corporate wellness programs, and public service locations such as transportation hubs.

The upstream of Smart Health Cabins mainly includes cabin structure and materials (sheet metal/steel frames, aluminum profiles, glass and soundproof materials), measurement sensors and medical hardware modules (blood pressure, SpO₂, temperature, body composition, ECG, etc.), display and interaction components (touchscreens, cameras, printing and payment modules), as well as software systems and communication modules (cloud platforms, data interfaces, telemedicine connectivity, and encrypted transmission). The midstream consists of cabin OEMs and system integrators responsible for industrial design, hardware selection, functional

integration, software deployment, and maintenance delivery. Downstream customers include community health centers and primary public health institutions, hospital checkup centers and outpatient triage points, corporate wellness programs, and public service sites such as transportation hubs and government service halls. Commercial models typically combine equipment sales with platform subscriptions and after-sales maintenance services.
