NFC is a mainstream wireless communication technology alongside WIFI, Bluetooth, ZIGBEE and other technologies. With the development of the times, NFC technology has been gradually integrated into the Internet of Things world and has become a part of it. NFC modules are more often installed on mobile phones. The Smartphone-based Near Field Communication (NFC) access control system is mainly composed of the

main control system, electric door lock, door sensor, NFC card reader monitoring terminal and background cloud server.

In the NFC access control system, the working principle is actually to use the NFC card reader and RFID scanning to identify the ID number of the mobile phone terminal, perform two-way data interaction, verify and obtain user information. After obtaining the information, through the 485 bus, the Modbus-RTU protocol is used to upload the user information of each access control to the control computer. The main control computer transmits and backs up the data to the background cloud server through the network, and performs real-time verification of the data. The result is returned to the computer, and then the computer sends the door opening information to the main access control system through the RS485 bus to control the card reader to unlock.
