The global Smartphone Chip Inductor market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

At present, smart phones have become the most closely related electronic products, and they are also the main force for the application of chip inductors. After comparison, it is found that the amount of inductance used in smartphones is three times that of non-smartphones, of which SMD inductors are the main ones. There are two types of chip inductors in smartphones: chip laminated inductors and NR magnetic glue inductors. In addition, other types of chip inductors are also equipped according to the needs of smartphone functions, such as integrated inductors. It is difficult for plug-in inductors to exist in smart phones, because only chip inductors can meet the structural requirements of smart phones, such as miniaturization, compact installation, and dense arrangement, and plug-in inductors cannot do it. The functions of chip inductors in smartphones mainly include: radio frequency choke, high frequency filtering, signal amplification, etc. DC-DC power supply modules for smartphones, LNA modules, SAW filter modules, AMP (signal amplifiers), etc.

Mobile phones rely on receiving signals and transmitting signals for information transmission. For transmitting signals in mobile phones, high-frequency ceramic inductors in chip inductors are needed. Mobile phones use high-frequency ceramic inductors not only because of their volume. Another important feature is that the high-frequency ceramic inductor has the function of frequency modulation. Under normal circumstances, the frequency of signal transmission of mobile phones is a transmission

frequency of more than 800 megabytes, because human ears and other parts cannot bear such a high frequency. Using high-frequency ceramic inductors can transmit and receive high-frequency signal frequencies of mobile phones tuned to fit the human body. There is another kind of chip inductor used in mobile phones, which is a small one-piece inductor. Similarly, its volume is relatively small, which can filter the clutter when the mobile phone is running. Of course, other inductors are also used in mobile phones, but most of the mobile phone filters now use integrated inductors. Of course, the focus of using inductors in mobile phones is high-frequency inductors. The higher the frequency, the better the signal transmission. It can also provide convenience and avoid some troubles during use.
