The global SoC Burn-in Testing Machine market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The SoC burn-in testing machine is a test device used to evaluate the reliability and life of the system-on-chip (SoC). It simulates the performance changes of the chip during long-term use by running the chip for a long time in extreme environments such as high temperature and high humidity. When in use, the SoC is installed on the tester, and the corresponding test parameters and environmental conditions are set to monitor the operating status and performance indicators of the chip in real time. Its advantage is that it can quickly discover potential faults and performance degradation, and improve product quality and reliability. At the same time, it has a high degree of automation and high testing efficiency, providing chip manufacturers with efficient reliability testing solutions.

United States market for SoC Burn-in Testing Machine is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
