The global Sodium Battery Negative Electrode Active Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Hard carbon is currently the mainstream anode material route for sodium batteries, and it is also the main constraint factor for the current scale of the sodium battery industry. Hard carbon materials have the advantages of diverse structures, low price, good conductivity, high sodium storage capacity, small volume deformation after sodium intercalation, environmental friendliness and low redox potential, and are currently the mainstream anode material route for sodium batteries.

The principle of sodium-ion batteries is similar to that of lithium batteries, and the industrialization foundation is good; my country?s lithium resource reserves are relatively insufficient, which may further restrain the development of the battery industry in the future; the theoretical cost of sodium-ion batteries is low, and the gap between energy density and cycle life and lithium batteries is gradually narrowing; The characteristics of high-rate low-temperature resistance and safety have unique advantages over lithium batteries. It is expected to initially form industrialization in 23 years, and it will grow explosively in the next few years, driving the growth of the related negative electrode material market.
