The global Sodium Hydrogen Sulphite Powder market size is predicted to grow from US\$ 783 million in 2025 to US\$ 947 million in 2032; it is expected to grow at a CAGR of 2.5% from 2026 to 2032.

Sodium hydrogen sulphite powder is an inorganic sulphite chemical product mainly composed of NaHSO_3 . It is usually supplied in white powder, crystalline, or solid form, and has reducing, dechlorinating, antioxidant, preservative, and bleaching functions. The product is mainly used in water treatment, textile dyeing and finishing, pulp and paper, food processing, pharmaceutical and chemical manufacturing, photographic development, mineral flotation, and industrial wastewater treatment. In the value chain, it sits at the intersection between basic fine chemicals and industrial treatment agents. Its supply forms include industrial-grade bulk powder and granules, as well as reagent-grade, high-purity, food-grade, and pharmaceutical-grade products. Its core value lies in steadily releasing bisulfite ions to participate in oxidation-reduction reactions, thereby enabling residual chlorine removal, color reduction, oxidation inhibition, process protection, and support for specific chemical synthesis.

The market foundation for sodium hydrogen sulphite powder is highly stable. Its demand is not determined by the cycle of a single industry, but is jointly supported by multiple mature application scenarios, including water treatment, pulp and paper, textile dyeing and finishing, food processing, pharmaceutical and chemical manufacturing, photographic development, mineral flotation, and industrial wastewater treatment. The product's core functions are concentrated in basic chemical effects such as reduction, dechlorination, antioxidation, preservation, and bleaching. It can be directly embedded into industrial production and environmental treatment processes, giving it the typical attributes of a process chemical. Water treatment dechlorination and industrial

wastewater reduction treatment constitute relatively strong rigid demand. In particular, in municipal water treatment, industrial circulating water, food and beverage processing water, and pre-discharge treatment, residual chlorine control, removal of oxidizing substances, and water quality stabilization all require reducing agents that are stable, cost-controllable, and clearly reactive. As industrial discharge regulations continue to tighten, the frequency and standardization of water treatment chemical use are expected to increase, and sodium hydrogen sulphite powder still has room for sustained growth in basic consumption within environmental treatment applications.

From the perspective of product structure, industrial-grade sodium hydrogen sulphite powder will continue to occupy the dominant position. This is because bulk applications such as water treatment, papermaking, textiles, and mineral processing place greater emphasis on procurement cost, supply stability, effective content, and reaction efficiency. Product competition is mainly reflected in large-scale production, logistics coverage, batch stability, and adaptability to downstream processes. At the same time, food-grade, pharmaceutical-grade, reagent-grade, and photographic-grade products form higher-value niche segments. These grades usually impose higher requirements on purity, impurity control, heavy metal limits, documentation compliance, packaging cleanliness, and batch traceability. Future industry growth is unlikely to rely on simple price increases. Instead, it is more likely to come from two directions: first, volume growth driven by the expansion of water treatment and wastewater treatment demand in industrial scenarios; second, value growth driven by the rising share of compliance-grade and high-purity products in food, pharmaceuticals, laboratories, and high-end manufacturing scenarios. Companies with multi-grade supply capabilities and quality documentation capabilities are more likely to build a portfolio advantage between low-margin basic products and higher-value niche products.

From a regional perspective, Asia-Pacific remains an important production and consumption center for sodium hydrogen sulphite powder. China, India, Japan, and South Korea all have relatively complete foundations in basic chemicals, textile dyeing and finishing, papermaking, food processing, electronic chemicals, and reagent supply. These foundations generate both bulk industrial product demand and demand for high-purity reagents and specialty chemicals. Although Europe and North America are relatively limited in terms of bulk capacity expansion, they show stronger characteristics in food and pharmaceutical compliance, high-purity reagents, laboratory supply, and professional distribution systems. Product value in these markets is more reflected in quality certification, application documentation, packaging specifications, and stable service. The overall competitive landscape features the coexistence of basic industrial chemical suppliers and high-purity reagent brands. The former acquire industrial

customers through scale, cost, and channel coverage, while the latter serve laboratories and high-requirement customers through purity, certificates, brand reputation, and small-package supply. As requirements for environmental governance, food safety, and pharmaceutical compliance continue to rise, industry competition will gradually shift from simple price competition toward comprehensive competition in grade completeness, stable delivery, and compliance service capabilities.
