The global Sodium-ion Battery Polyanionic Compounds market size is predicted to grow from US\$ 135 million in 2025 to US\$ 233 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Sodium-ion Battery Polyanionic Compounds are a class of cathode materials in sodium-ion batteries whose crystal frameworks are built from stable multi-atom anion groups, such as phosphate (PO_4^{3-}), pyrophosphate ($\text{P}_2\text{O}_7^{4-}$), sulfate (SO_4^{2-}), or silicate (SiO_4^{4-}). These polyanion groups form a rigid three-dimensional skeleton that hosts transition metals (e.g., Fe, V, Mn) and provides channels for Na^+ intercalation/de-intercalation during charge and discharge. The strong covalent bonds within the polyanion units confer high structural and thermal stability, good safety, and long cycle life, while the so-called inductive effect of the anion groups can raise the operating voltage. As a trade-off, polyanionic cathodes typically have lower electronic conductivity and moderate energy density, so they often require carbon coating or doping. Owing to their safety and durability advantages, sodium-ion polyanionic compounds are especially attractive for grid-scale energy storage, telecom backup power, and other long-life, cost-sensitive applications. In 2025, global Sodium-ion Battery Polyanionic Compounds production reached approximately 17000 tons, with an average global market price of around US\$8100 per ton. The production capacity for Sodium-ion Battery Polyanionic Compounds in 2025 was approximately 20000 tons. The typical gross profit margin for Sodium-ion Battery Polyanionic Compounds between 20% and 40%.
