The global Sodium Permanganate market size is predicted to grow from US\$ 70.11 million in 2025 to US\$ 92.70 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

Sodium permanganate is the inorganic compound with the formula NaMnO_4 . It is a purplish colored crystalline solid. Sodium permanganate is a more convenient and concentrated form of permanganate when used for electronics and organic oxidation of fine chemicals and pharmaceuticals. It is also an effective oxidant recommended for potable drinking water applications including iron removal, manganese removal, mercaptan odor control, color reduction, and radium reduction. In 2024, global Sodium Permanganate production reached approximately 15.16 K MT, with an average global market price of around US\$ 4562 per MT.

Demand for sodium permanganate is strongly supported by its use as a liquid oxidant in water treatment and environmental remediation. Municipal and industrial water systems need reliable oxidation agents to control taste, odor, manganese, iron, sulfides and certain organic contaminants before filtration or further treatment. Sodium permanganate is attractive because it is highly soluble and can be dosed as a liquid, which improves handling convenience and allows more accurate feed control compared with solid oxidants in many treatment systems. In groundwater and soil remediation, it is also used for in-situ chemical oxidation, where controlled injection and distribution of an oxidant are important for degrading target contaminants and managing subsurface treatment performance.

Industrial process applications also support demand. Sodium permanganate is used in chemical oxidation reactions, wastewater treatment, odor control, sulfide management,

surface preparation and selected electronic or specialty chemical processes. Customers in these applications often value its strong oxidation potential, liquid dosing convenience and ability to function under a range of aqueous conditions. As industrial users face stricter discharge limits, odor complaints, process cleanliness requirements and workplace safety expectations, liquid permanganate products can provide a practical treatment option, especially where continuous dosing and rapid response are needed.

Another important driver is the preference for stable, high-purity and easier-to-handle oxidant systems. Because sodium permanganate is a strong oxidizer, customers pay close attention to product concentration, impurity profile, packaging safety, storage stability, dosing compatibility and supplier reliability. High-end applications require consistent quality and lower impurity levels, while water treatment and remediation users require dependable logistics and technical support. This favors established manufacturers with dedicated permanganate production, strong quality control, safe packaging systems and application know-how, rather than general chemical traders or small-scale distributors.
