Abstracts

The global Sodium Salt Energy Storage Battery market size is predicted to grow from US\$ 59.39 million in 2025 to US\$ 129 million in 2032; it is expected to grow at a CAGR of 11.9% from 2026 to 2032.

In 2024, global sodium salt energy storage battery production reached approximately 113 MWh, with an average global market price of around US\$ 500 per kwh. Sodium salt energy storage battery is a kind of secondary battery that uses sodium ions to store and release energy by moving between positive and negative electrodes. It has the characteristics of abundant reserves, low cost, high safety, long cycle life, etc. Sodium salt battery is mainly used in large energy storage systems (such as grid energy storage, photovoltaic energy storage), electric vehicles (especially light vehicles) and household energy storage and other fields.

The annual production capacity of a single sodium salt energy storage production line is typically 3,000-5,000 kWh/year, with a gross profit margin of around 26%.

The downstream consumption of sodium salt energy storage products is as follows: industrial (60%), commercial (15%), residential (25%), and other (17%).

Market Concentration and Key Players:

Internationally, the market concentration of sodium salt energy storage batteries is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, GE and other large manufacturers; from the domestic point of view, sodium salt energy storage battery manufacturers have Inner Mongolia Jianheng Aoneng Technology.

Manufacturing Processes and Market Trends:

The core of the manufacturing process of sodium salt energy storage battery lies in its solid-state battery characteristics. The functional structure integrated ceramic tube prepared by special alumina is used as electrolyte, and the anode is filled with inorganic salt and metal materials with high temperature resistance. The highly automated intelligent production line integrates AI vision inspection and digital twin system, realizing precise control of the whole process from electrode preparation to battery assembly. The key links are uniformity of slurry coating, precision control of cell winding or lamination, and liquid injection and formation process for sodium ion characteristics. Market trends show that sodium salt batteries are accelerating from demonstration projects to large-scale commercial applications by virtue of their intrinsic safety (they will not burn and explode even if they are shot or collided), wide temperature range (adapt to the environment of -40 °C to 60 °C above zero) and long cycle life, especially in the fields of large-scale energy storage on the grid side, industrial and commercial power backup and extreme environment communication base stations. At present, the industrial ecology is initially formed, and the policy support is clear. Leading enterprises such as Jianheng Aoneng have realized the mass production of 720V high-voltage sodium salt battery, and verified the reliability through demonstration projects in extremely cold and hot areas. In the future, with the continuous optimization of the material system and the coordinated cost reduction of the industrial chain, sodium salt batteries are expected to form a pattern of "lithium sodium complementarity" with lithium batteries, and jointly promote the development of the energy system towards diversification and high toughness.
