The global Sodium Trititanate market size is predicted to grow from US\$ 189 million in 2025 to US\$ 310 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

Sodium Trititanate ($\text{Na}_2\text{Ti}_2\text{O}_7$) is a layered sodium titanate compound widely used as a precursor material in advanced ceramics, ion-exchange systems, catalysts, and increasingly in sodium-ion and lithium-ion battery anodes due to its open crystal structure and ion intercalation capability. Its supply chain begins upstream with titanium-bearing raw materials (primarily rutile or ilmenite) and sodium sources such as sodium carbonate or sodium hydroxide. These feedstocks undergo high-temperature solid-state reactions or hydrothermal synthesis to form sodium trititanate powders or nanostructures. Midstream processing includes particle size control, surface modification, and shaping (e.g., nanotubes, nanorods, or ceramic bodies) to meet application-specific requirements. Downstream, the material is integrated into battery electrodes, catalytic systems, ion-exchange materials, and functional ceramics, with demand driven by energy storage, environmental remediation, and electronic materials industries. The value chain is characterized by a mix of chemical manufacturers, advanced materials companies, and battery material developers, with increasing R&D focus on scalable nanostructuring and performance optimization. In 2025, global Sodium Trititanate output was about 110,000 tons with 150,000 tons of capacity, average prices of USD 1,500-3,000 per ton, and gross margins around 28%.
