SOFC Ceramic Electrolyte Sheet is a dense, sheet-shaped oxygen-ion-conducting ceramic used in solid oxide fuel cells. It is typically positioned between the fuel electrode and the air electrode, where it conducts oxygen ions, provides electronic insulation, and prevents direct mixing of the fuel gas and air. The product is generally manufactured from YSZ, scandia-stabilized zirconia, doped ceria, or other ceramic electrolyte materials through powder preparation, tape casting or pressing, sintering, flattening, and precision finishing. It features high density, strong ionic conductivity, high-temperature resistance, and good chemical stability.

Upstream materials mainly include zirconia, yttria, scandia, ceria, organic binders, dispersants, and sintering additives. Midstream production involves powder formulation, tape casting, debinding and sintering, precision processing, and performance testing. Downstream customers are primarily manufacturers of SOFC cells and stacks, with end-use applications covering distributed power generation, combined heat and power, backup power, transportation auxiliary power, and utility-scale power generation.
