The global Soft Solder Die Attach System market size is predicted to grow from US\$ 313 million in 2025 to US\$ 478 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Soft Solder Die Attach System is an automated back end semiconductor packaging system used for die picking, vision alignment, placement, and metallurgical bonding with tin based soft solder. Under controlled temperature, bonding force, bonding time, and nitrogen or low oxygen atmosphere, the system picks singulated dies from wafers, films, or carriers and attaches them onto leadframes, copper substrates, ceramic substrates, or power module substrates. A typical system consists of wafer loading and die picking modules, vision alignment, solder feeding, heated bonding stages, force control, low oxygen process chambers, leadframe or substrate handling, inline inspection, and process control software. It supports solder wire, solder ribbon, solder preforms, and solder paste, and is mainly used for TO, DPAK, PDFN, power MOSFET, IGBT, diode, rectifier bridge, SiC power device, and selected power module packages. Major manufacturing bases include the Netherlands, Singapore, China, Japan, Germany, and the United States, with demand mainly from power device IDMs, OSATs, and power module manufacturers.

In 2025, global Soft Solder Die Attach System shipments reached approximately 280-350 units, while mainstream fully automatic production systems were typically priced at about USD 0.85-1.50 million per unit on an FOB basis. High end systems with 12 inch wafer compatibility, high speed leadframe handling, low oxygen control, inline inspection, stable temperature control, and process traceability were positioned near the upper end of the range. In 2026, global shipments are expected to increase moderately, supported by power semiconductor capacity expansion, automotive grade device

packaging upgrades, SiC power device ramp up, and assembly capacity renewal in Asia, while mainstream pricing is expected to remain broadly stable with a rising share of premium configurations.

The global Soft Solder Die Attach System market is entering an upgrade cycle driven by power semiconductor packaging requirements. Electric vehicles, charging infrastructure, photovoltaic inverters, energy storage systems, industrial power supplies, server power systems, and fast charging consumer electronics are raising requirements for heat dissipation, electrical conductivity, solder layer uniformity, and long term reliability. As a result, soft solder die attach remains an important process for power discrete devices and selected power module packages. Compared with epoxy die attach, soft solder bonding provides better thermal and electrical performance; compared with advanced bonding technologies such as silver sintering and copper sintering, it still offers advantages in cost, throughput, process maturity, and supply chain readiness for established power packages. Fully automatic systems with high speed leadframe handling, 12 inch wafer compatibility, low oxygen atmosphere control, stable solder feeding, inline vision inspection, and data traceability are becoming key purchasing priorities for OSATs and power device manufacturers.

The main market constraints come from narrower process windows, long customer qualification cycles, and substitution pressure from advanced packaging technologies. Soft solder die attach requires strict control over solder spreading, void rate, oxidation, die shift, bond line thickness, interface reliability, and thermal cycling life. Equipment suppliers therefore need capabilities in mechanical precision, thermal process control, low oxygen management, motion control, and process database optimization. Automotive grade power device qualification cycles are relatively long, and equipment procurement can also be affected by semiconductor capital expenditure cycles, OSAT expansion schedules, and downstream inventory fluctuations. Over the medium to long term, silver sintering, copper sintering, and advanced power module packaging will capture part of the demand in high heat flux applications. However, in mass produced mature packages such as TO, DPAK, PDFN, power MOSFET, IGBT, diode, and rectifier bridge packages, Soft Solder Die Attach Systems will retain a solid demand base, with future growth mainly driven by Asian assembly capacity upgrades, China's equipment localization, SiC device production ramp up, and automation upgrades in automotive grade power device packaging.
